ADHESIVE SILICONE WOUND CONTACT LAYER

GENTLE CONTACT LAYER ALLOWS THE TRANSFER OF EXUDATE WHILST MINIMISING PAIN AT DRESSING CHANGES.

MINIMISES EPIDERMAL STRIPPING
REDUCES PAIN AT DRESSING CHANGES
PROTECTS THE PERIWOUND
14 DAYS IN SITU
CASE STUDY

A 88 year old lady was admitted to an Acute Hospital within the UK following a fall where she sustained traumatic wounds to the left upper arm, left leg and head. She had a past medical history of atrial fibrillation and was on Warfarin. The wound measured 10cm in length, 6cm in width and 0.2cm depth and was dressed with ActivHeal Silicone Wound Contact Layer dressing along with a non bordered foam to absorb exudate and a bandage to retain the dressing.

By the fourth and final dressing change prior to discharge of the patient further significant progress had been made. The wound had reduced in size, exudate levels were low and 70% epithelial tissue and 30% granulation tissue was visualised. The patient dressing regime continued and the patient was discharged.

ActivHeal® Silicone Wound Contact Layer dressing is a sterile wound dressing consisting of a knitted polyester fabric coated with silicone adhesive on both sides.

With wound management being increasingly outcome driven, pain is a major issue for patients with wounds of different aetiologies, as many patients experience transient wound related pain when the wound dressing is applied and/or removed. Silicone wound contact layer dressings are often used to increase comfort for the patient, during dressing change.

ActivHeal® Silicone Wound Contact Layer dressing is a primary dressing for use when adherence to the wound is a potential problem. The dressing allows exudate to pass into an absorbent secondary dressing. The silicone creates a layer between the dressing and the skin surface which allows the dressing to be removed while minimising trauma, pain, or damage to the delicate new tissue at the wound margin. On the skin, the dressing will provide secure adhesion with minimal epidermal stripping or pain on removal.

FEATURES

Highly conformable // Allows passage of exudate // Can remain in situ for up to 14 days // Promotes healing through a moist wound environment // Protective layer on non exuding wounds such as blisters and fragile skin tears // Minimises epidermal stripping // Minimises pain at dressing changes // Protects the periwound

PERFORMANCE

ActivHeal® Silicone Wound Contact Layer is a primary dressing. A secondary absorbent dressing is required if exudate is present. In comparison with similar contact layers the ActivHeal® Silicone Wound Contact Layer is shown to be more extensible, therefore making it more conformable and subsequently easier to apply to difficult areas to dress.

Conformability (kgfcm-1)²

INDICATIONS

ActivHeal® Silicone Wound Contact Layer dressing is indicated for use on nil to heavily exuding chronic and acute wounds (with appropriate secondary dressing). The dressing may be used throughout the healing process on the following wounds:

- Skin tears
- Partial thickness skin grafts
- Surgical incisions
- Venous ulcers
- Pressure ulcers
- Arterial ulcers
